amino-terminal sequences suggest identity of the fetal heart and the adult liver isoform.";

Eur. J. Blochem. 230:235-241(1995).

-!- FUNCTION: THIS PROTEIN IS ONE OF THE NUCLEAR-CODED POLYPEPTIDE CHAINS OF CYTOCHROME C OXIDASE, THE TERMINAL OXIDASE IN MITOCHONDRIAL ELECTRON TRANSPORT. THIS PROTEIN MAY BE ONE OF THE HEME-BINDING SUBUNITS OF THE OXIDASE.

-!- CAPALYTIC ACTIVITY: 4 ferrocytochrome c + O(2) = 4 ferricytochrome c + 2 H(2)O.
                                                                                                                                                                                                                                                                                                   Gaps

```
The present sequence represents a peptide of lectin derived progenitor

a cell preservation factor. The protein is used to preserve unipotent,

pluripotent or totipotent progenitor cells, especially haematopoietic

cells, and also progenitors from nerve, muscle, skin, gut, bone,

kidney, liver, pancreas or thymus. Specific applications are

preservation of cultured cells intended for administration after

conticancer) myeloablative therapy (bone marrow or whole-body irradiation

con chemotherapy) to reconstitute the haematopoietic system; enrichment

con progenitor cells (e.g. during ex vivo purging of malignant cells);

treatment of tissues containing haematopoietic progenitors for subsequent

transplant to improve haematopoietic competence; improving transfer of

transplant to improve haematopoietic competence; improving transfer of

scogenous DNA to progenitor cells (in gene therapy of various

containst ablative therapy (to eliminate proliferating cells specifically),

against ablative therapy (to eliminate proliferating cells specifically),

collowed by re-establishment of differentiation and proliferation of

preserved progenitors. The protein, when linked to magnetic beads, may

also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                  reconstitution after ablative therapy, and to increase DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            progenitor cell preservation factor; radiotherapy; chemotherapy; progenitor cell; hemangioblast; mesenchymal stem cell; cancer; severe combined immunodeficiency; aplastic anemia; tissue repair.
  cells - particularly haematopoietic progenitors, useful for bone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;

reducing the hematopoietic progenitor cell-depleting activity of the reapeutic treatment, including radiotherapeutic and/or therapeutic treatment, including radiotherapeutic and/or therapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment can be administration of the patient of FRIL composition of the patient. FRIL family members are useful for isolating population of progenitor cells, hemandioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from cancer. It is also administered to patients having, or predisposed to developing conficient where the patients having, or predisposed to developing depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                             receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or
                                                                              The present sequence is derived from a FRIL (F1K2/F1t3 tyrosine kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Identification; detection; microbe; gyrase gene; gyrase protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          detection of a microbe, using the gyrase gene as the index. The method involves the use of PCR primers to amplify DNA from the microbe, which is then identified or detected depending on its base sequence. The method can be used to classify and identify an unidentified microbe strain rapidly and with high precision.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        - by detection of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present peptide is an antigen derived from human interleukin 9 (hIL-9) receptor, also known as asthma associated factor I, which can be used to raise antibodies (Ab) that block the binding of hIL-9 to its receptor. hIL-9 plays a role in acopic allergy, asthma and related disorders, e.g. bronchial hyperesponsiveness (BHR), rhinitis, urticaria, allergic inflammatory disorders of the bowel and various forms of eczema. Compounds which down regulate the function of IL-9, e.g. antisense DNA, Ab, truncated (soluble) in a dits splice variants and other IL-9 or IL-9 receptor. Ab are also useful for alleviating such diseases. Anti-IL-9 have also useful for quantifying IL-9 in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human interleukin-9 variant with Met at position 117 - useful for treating atopic allergy, esp. asthma

The insertions are esp. epitope sequences from viruses and the modified subunits, or microorganisms expressing them, are useful as immunogens. Pref. the subunit has at least one insertion and/or substitution by a heterologous peptide in one of the regions -13 to +8, 10-58, 123-164 or 183-277 Esp. the modifications are made in the regions corresp. to natural epitopes of CS31A as these are the most accessible sites on the folded protein. The epitopes were identified and localised by assaying antipeptide capture. This peptide was shown to correspond to an accessible region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sub-unit of capsular protein CS31A contg heterologous sequences useful for representation of heterologous epitopes in vaccines, for antibody prodn and in immunological tests
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó

bind Hsp47 external domains. Hsp47-binding agents can be may be used to treat Hsp47-expressing carcinomas, and for modulating the activity of a treat Hsp47-expressing carcinomas, and for modulating the activity of a tumour cell with respect to invasion, migration, motility or metastasis, or to its interaction with the extracellular matrix. The targetting moiety (such as an Hsp47-binding peptide, a toxin or an antibody) may be coupled with a therapeutic moiety (such as a cytotoxic agent or a therapeutic gene) for cancer treatment, or with a detectable moiety for imaging. Carcinomas which may be treated or diagnosed according to methods of the invention include those of the skin, basal cells, large intestine, lung, colon, breast, bladder, oral, head and neck, larynx, nasopharynx, adrenal cortex, apocrine glands, kidney, liver, pancreas, or prostate. Targetting carcinoma cells with Hsp47-binding agents results in effects and sensitive detection or imaging of carcinoma cells. Sequences ABB2304-B2340 represent phage display library heptapeptides identified as being able to bind Hsp47 in an exmplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating, diagnosing or modulating a carcinoma cell, which expresses Heat shock protein 47 on its surface, involves administering an agent comprising targeting moiety which binds to Hsp47 external domain

The present invention provides antibacterial compounds which are able to
                                                                                                                                                                                                                                                                                                                                                                         interfere with Gram-negative bacteria pilus formation and assembly, and pilus interaction with Chaperone proteins. These are useful in the treatment of bacterial infection, and in the prevention of biofilm formation. They are particularly useful against Escherichia coli, Haemophilus influenzae, Salmonella enteritidis, S. typhimurium, Borderella pertussis, Yersinia enterocolitica, Helicobacter pylori and Klebslella pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         interfere with Gram-negative bacteria pilus formation and assembly, and plus interaction with Chaperone proteins. These are useful in the treatment of bacterial infection, and in the prevention of biofilm formation. They are particularly useful against Escherichia coli, amemophilus influenzae, Salmonella enteritidis, S. typhimurium, Bordetella pertussis, Yersinia enterocolitica, Helicobacter pylori and Klebsiella pneumoniae.
                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            compound; Gram-negative bacterium; pilus; chaperone;

CHA255 is a murine monoclonal antibody (MAD) which is capable of binding complexes.

Mutagenesis of these CDRs, causes the production of polypeptides with a particularly high binding affinity for EDTA or DOTA metal complexes. CDR and -3 of the heavy chain, and CDR2 and -3 of the light chain were targeted for mutagenesis. Five residues of both CDR1 and -3 of the nine light chain CDR3 residues were specifically targeted for codon-based mutagenesis. The mutagenised MAD's can be used in compositions for in vivo imaging of malignant tissues or tumours. They are also useful for the treatment of malignant tissues or tumours eg.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     colorectal or breast cancer. Both methods involve the use of radionuclides which bind to metal chelates or haptens which are specifically delivered to the target site by a targetting molecule. CI derived peptides may be used to construct bi-functional antibodies having dual specificities, or as donor or recipients of CDR sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chain; complementarity determining region; CDR; variable; constant; region; monoclonal antibody; MAb; binding affinity; EDTA; DOTA; tumour; cancer; colorectal; breast; metal chelate; hapten.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a peptide fragment of T21/DP107. T21/DP107 is helical segment of the ectodomain of HIV-1 protein gp41. T21/DP107 is located in the amino terminus of the gp41 ectodomain. gp41 plays a critical role in the fusion of HIV-1 and host cell membranes. T21/DP107 interacts with members of the formyl peptide receptor (FPR) family and thereby up-regulates an inflammatory response, and acts as a potent chemoattractant and activator of human peripheral blood phagocytes (but not T cells). The present peptide can be used to modulate an inflammatory response in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HIV-1; gp41 N-helical domain; gp41 heptad repeat region; coiled coil; core 6-helix bundle; viral entry inhibition; immunogenic; antibody; humoral response; broad spectrum vaccine; anti-HIV;

Sequences Ashieron-Tentron Teperacus centron to the spatial percents centralising antibody response to a broad spectrum of HIV-1 group M, subtype B, isolate LAI. The invention relates to raising a neutralising antibody response to a broad spectrum of HIV-1 (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or mimics highly conserved portions of gp41 which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or mimic the coiled coll solution structure of the N-helical domain (the transmembrane-proximal amphipathic alpha-helical segment), or can correspond or mimic the coiled coll solution structure of the N-helical segment), or the gp41 core 6-helical domains of three gp41 proteins. The peptides can be administered either singly or as a combination (particularly a combination of N-helical and C-helical domain peptides can be multimerised. For example, N- and C-helical domain peptides can be alternately linked together to form a peptide which mimics the core chelix bundle. Administration of the peptide which mimics the core chelix bundle administration of antibodies against gp41 structures involved in viral entry. As these portions of gp41 are well conserved, and conserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    such antibodies may be effective against a broad range of HIV strains and isolates. The peptide compositions may be administered as a prophylactic or therapeutic vaccine to generate antibodies which reduce or inhibit the ability of HIV to infect uninfected cells. A composition comprising polyclonal or monoclonal antibodies can be administered to entry-relevant gp41 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a modified anti-viral peptide (1) comprising a peptide that exhibits anti-viral activity and a reactive group which is reactive with amino groups, hydroxyl groups, or thiol groups on blood components to form stable covalent bonds. (1) has anti-viral and anti-fusogenic activities. (1) inhibits viral infection of cells by inhibiting cell-cell fusion or free virus infection or to reduce the level of membrane fusion events between two or more entities. (e.g., virus cell or cell-cell, relative to the level of membrane fusion that occurs in the absence of the peptide. (1) is useful in the treatment of patients who are suffering from viral infection, e.g. HIV, RNV, HPIV, MeV, and SIV. (1) may be administered prophylactically to previously uninfected individuals. This is useful in cases where an individual has been subjected to a high risk of exposure to a virus. By bonding of long-lived components of the blood, such as immunoglobin, serum albumin, red blood cells and platelets the activity is extended for days to weeks. This is due to improved stability in vivo and a minimises the need for more frequent, or even continual, administration of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

refective amounts of T cells. The TCRS are chosen from V beta 5.7. V beta 6.7. V beta 5.7. V beta 6.7. Appears 13. The V beta 70x V beta 6.7. Appears 13. The V beta 70x V beta 6.7. Appears 6.0. C treatment of multiple sclerosis (48). The presence of V beta 6.7 Appears 10.0. V beta 6.7. Appears 10.
   Expression; epitope; recombinant vector; structural gene; bacteriophage; identification.
   Gaps
   specification describes vaccines which comprise immunologically
   Vaccine; T cell receptor; TCR; T cell; V beta 6.2/3; V beta 6/5; V beta 6.7; V beta 2; V beta 5/1; V beta 7; V beta 13; V beta 6;
V beta 6 clone found in MS patients after vaccination with TCR.

The invention relates to the expression of epitope peptides from recombinant vectors which contain a recombinant structural gene into which a random ollopouclectide of sequence GATCCTIN(15)Ah has been inserted. Sequences X16832-X16845 represent examples of the inserted oligonuclectides. Several of the peptides encoded by the oligonuclectides have been shown to to have similarity to proteins in the Genbank sequence database. This sequence is a fragment of the human fibrinogen gamma A/B chain precursor protein and is example of a homologous peptide sequence. The recombinant peptides are then expressed on the surface of an organism e.g. a bacteriophage, for ease of identification. The invention may be used for the identification and characterisation of peptide epitopes.
   Population of recombinant vectors, oligonucleotides and random peptide sequences - useful for the identification and characterisation of peptide epitopes

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PIR\_73:\*
1: pir1:\*
2: pir2:\*
3: pir3:\*
4: pir4:\*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                            The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for
   e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.
   Gaps
   The sequence corresponds to the N-terminal region of a human Flk2 receptor protein-tyrosine-kinase ligand, isolated from phytohemagglutinin-stimulated human peripheral blood leukocyte
  ;
0
   human F1k2 receptor protein-tyrosine-kinase ligand; peripheral periperal blood leukocyte conditioned medium; bone marrow disorder diagnosis; hematopoietic stem cell;
  Ligand for receptor protein tyrosine kinase - useful for the
   stimulation of primitive haematopoietic stem cells causing proliferation and/or differentiation

The present sequence is derived from FRIL (FIRZ/FIL3 tyrosine kinase receptor-interacting lectin), and is used to raise antibodies. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemcherapeutic treatment. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of
  Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
tissue culture conditioned medium. The ligand may be used in diagnosis of bone marrow disorders, and to stimulate the proliferation and/or differentiation of primitive hematopoietic stem cells. The ligand binds to a receptor protein tyrosine kinase expressed in primitive but not mature mammalian hematopoietic cells.

  The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for e.g. expanding PC populations ex vivo to increase chances of
      so that the patient can receive a higher dose of the
  engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases
                      chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopotetic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

CC Fig. 1, Al., Al., Al., Al. or Al. or HiA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are cormally induced by an antigen in the form of a peptide fragment bound to a HiA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C. AIDS, and renal carcinoma.

They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunosemic peptides are also useful

therapeutically and for immunisation as above.

   The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500).

TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 proteins activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. The present sequence is one such peptide fragment of TADG-15.
  Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer

The present invention relates to human tumour antigen-derived gene 15 (TADG-15) protein and coding sequence (see AAH23601 and AAB98500).
TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for vaccinating an individual against TADG-15, having, suspected of having or at risk of getting cancer. The present sequence is one such peptide fragment of TADG-15.
  The present invention describes a nucleic acid molecule (I) encoding at least one complementary determining region (CDR) of a variable region of an antibody which specifically interacts with the extracellular domain of the human zeta-chain. The antibody whose CDR of a variable region is encoded by (I), is obtained by immunising a rat with jurkat cells and subsequently with a conjugate comprising a carrier molecule and a peptide having 11 N-terminal amino acids of a rat zeta-chain. The anti-zeta-chain antibody is useful for the treatment and prevention of auticimune designed actions of the conformation of the conformation of the conformation of the conformation diseases, immune deficiencies, T-cell malignancies,
  infectious diseases and the suppression of immune response preferably in order to avoid graft rejection after organ transplantation, malignancies, or viral infections. The antibody, and fragments of it, can be useful for the enhancement or suppression of NK-cell dependent immunity or for the treatment of NK-cell derived malignancies. It can also be useful for the
   complementary determining region; CDR; autoimmune disease; cytostatic; immune deficiency; T-cell malignancy; infectious disease; antiviral; immunosuppressive; antimicrobial; immune response modulator; NK-cell.

   The present invention describes cadherin modulating agents (MA) comprising peptides which comprise a nonclassical cadherin cell adhesion recognition (CAR) sequence. The MAs can be used for modulating nonclassical cadherin-mediated functions. They can be used for e.g. inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, eqhancing delivery of a drug through the skin of a mammal,
determination of zeta-chain or eta-chain expression on NK-cells, T-lymphocytes or their precursors. The present sequence represents the CDR1 of the VH-region of the anti-zeta-chain antibody 2-B-5, produced
